Hi alex...
To answer you question....

Xml is a data definition, as such it is public. About all you can really do to it is copyright it. Api's are the same. My goal for the xml is to create something that can be submitted to the nmra as a future standard.

Like wise, the xml definitions you use in jmri for the data files I suspect that you would like to see them submitted.

My goal on the train server API's and the xml is to create something that everyone can use, and to get more apps created.

How a developer implements it is up to them, as well as what technologies the developer chooses to use to implement it.

In our case we use windows ce, .net and Microsoft platforms (win 2k and xp).

Matt k.
